EDUCATION

Northeastern University, Boston, MA

May 2026

Candidate for Bachelor of Science in Electrical & Computer Engineering

GPA: 3.85

Relevant Coursework: Circuits & Signals | Embedded Design | Digital Design & Computer Organization | Networks | Discrete Structures | Probability and Statistics | Differential Equations and Linear Algebra

Activities: Generate Product Development Studio (Hardware Engineer), University Honors Program, Intramural Soccer

TECHNICAL SKILLS

Programming Languages: C++, Python, MATLAB, NI LabVIEW, SystemVerilog, Assembly

Platforms/Tools: Linux, Git, KiCAD, LTspice, Xilinx Vivado, Quartus Prime

Hardware: PCB Schematic Design & Layout, Microcontroller, FPGA, Arduino, Oscilloscope, Multimeter, Soldering

WORK EXPERIENCE

Philips, Andover, MA

Hardware Test Engineering Co-op

Jan. 2024 – Present

- Develop automated test systems using NI LabVIEW to qualify Philips products against international standards, reducing pre-market approval times by 60% and saving \$150,000 in development costs
- Conduct reliability testing on Philips products using HALT systems to identify critical failure modes and formulate design improvements, increasing product service life by 20%

Rite Aid, Hopkinton, MA

Data Security Intern

June 2023 – Aug. 2023

- Scripted 1119 Invoke-Atomic Red Team tests using PowerShell and developed custom security alerts on telemetry received from CrowdStrike Falcon, improving Rite Aid's defensive capabilities
- Investigated 532 unidentified Indicators of Compromise and formulated unique regex patterns for use in Rite Aid's endpoint security integrations, successfully preventing a critical security breach

PROJECTS

C-STAR: Autonomous Concrete Sounding Robot

Jan. 2024 – Present

- Design hardware for an autonomous concrete sounding robot that detects delaminations in concrete structures
- Create a custom PCB integrating an ESP32 microcontroller and Lidar sensor to accurately map the robot's surroundings
- Develop odometry and PID algorithms to autonomously drive the robot using Ubuntu, FreeRTOS, microROS, and C++

SEBIK: Automated Tabletop Injection Molder

Sept. 2023 – Dec. 2023

- Developed an automated tabletop injection molder seeking to provide a solution to medical supply shortages by rapidly producing common medical products on demand
- Designed a custom PCB using KiCAD to receive sensor readings and control solenoids with an ATmega328PB microcontroller, allowing 10.45 grams of molten polypropylene to be injected every four minutes
- Analyzed potential failure modes within the injection ram subsystem using a DFMEA and developed robust error handling mechanisms using C++, ensuring user safety throughout the injection process

HeatWave: Contactless Stovetop

Sept. 2023 – Dec. 2023

- Collaborated with an interdisciplinary team of 8 engineers in developing a contactless stovetop that allows the user to control the stovetop using hand gestures
- Engineered ultrasonic motion detectors using C++ and Arduino, improving cooking efficiency by allowing users to precisely switch between five distinct heat settings

Python Chess Engine

May 2023 – Aug. 2023

- Programmed a chess engine from scratch using Python and PyGame, allowing the user to play matches against the 1000 ELO engine
- Implemented an intuitive user interface with customizable board color schemes and automatic algebraic notation, enhancing user experience
